

Abel Ghebrezadik

Lead/Senior Software Engineer

Address: Enfield, London, United Kingdom | Phone: 07527841324

Email: abel_g@hotmail.co.uk | LinkedIn: linkedin.com/in/abel-ghebrezadik | Website: abelghebz.com | GitHub: github.com/negus14

Profile

Senior Software Engineer with 9 years' experience across Tech: Finance, Property, Health, and Gambling. Self-taught developer with a Mathematics degree and a strong analytical mindset. Proven track record in leading greenfield projects, resolving legacy tech debt, and deploying scalable backend systems using .NET, AWS, and modern ORMs. Effective communicator with leadership experience, mentoring junior engineers and stepping into Lead Developer roles as needed.

Technical Skills

AI: Claude

Languages: C#, Python, TypeScript, Java, C++, JavaScript

Web Frameworks: .NET (Core/Framework), React.js, Vue.js, Node.js, Blazor

Mobile Frameworks: React Native, Progressive Web Apps (PWA)

Databases: MSSQL, MySQL, PostgreSQL, MongoDB, Snowflake

Cloud & DevOps: AWS (Lambda, API Gateway, CloudFormation), Serverless Architecture, Terraform

CI/CD: Docker, GitHub Actions, ArgoCD

Version Control: GitHub, Bitbucket

IDEs: Visual Studio, Visual Studio Code, Cursor

Tools & Practices: Dapper, Microservices, REST APIs, HTTP v 2, GraphQL, Unit Testing, Agile Methodologies, LLM, Prompt Engineering, AI Integration, gRPC, SignalR, Redis, Kafka, Kubernetes, Orleans, Kubernetes

Work Experience

Full Stack Developer

Arena Entertainment - December 2025 to Present. Crypto Gambling company. Optimised performance for users in current admin platform in Angular/TypeScript. Rebuilding future admin platform in React/Typescript and C#.

- On the current Angular/TypeScript admin platform, I created an AI chat bot for admin users, integrated with AWS Bedrock and Claude Haiku model, using a 130-file user guide I created for background context so now users can query AI to help navigate platform.
- Highlighted performance inefficiencies using AI, data, logs in TypeScript/Node.js backend adhering to big O notation and reducing inefficient code.
- 50% speed improvement in critical Warehouse, Snowflake and Database, MySQL queries, highlighting new db indexes, refactoring inefficiencies stripping optional relational data to avoid cartesian explosion
- Reducing latency, by up to 8s, for all API calls 94% hit rate avoiding cold starts. AI strategy, to use warm up pings in lambdas and concurrency to ensure latency times, caching preflight checks for reduction in cold starts.
- Enhanced Redis developed further, adding batch pipelines to reduce network round trips.
- Rewrote and standardised data tables, allowing prefetching and implemented keyset and cursor pagination, to remove loading of large datasets.
- Created QA automation application to test admin platforms using AI, integrating playwright, Bitbucket, GitHub, Jira MCPs to scan tickets and generate UI tests and provide reports to expedite manual testing and wholesale changes.
- Implementing a new full stack application in React and .NET, DDD using .md files, CQRS events published by Kafka internally, gRPC interservice comms.

Lead/Senior Software Engineer

Betmate/Engage Games - April 2025 to July 2025. Sports betting company. Built multiplayer game for leading sports betting company with jackpots ranging from £20k-£500k jackpot. Scaled to 1M users.

- Designed and developed a high-performance C# backend application using AI, deployment strategy using GitHub Actions and AWS Lambda (serverless architecture) for scalability and cost-efficiency. Designed to scale for up to 100ks of users, it scaled to 1M users,
- Integrated CockroachDB with Dapper ORM, optimising for distributed SQL performance and lightweight data access.

Abel Ghebrezadik

- Implemented CI/CD pipelines and infrastructure-as-code using AWS tools (e.g., API Gateway, Lambda, CloudFormation).
- Built event driven architecture using SNS and SQS.
- Curated a list of podcasts 50 – 250k followers, popular football clubs, influencers to reach out to the football community. Actively reached out to my network to help build partnerships and introduce company to Premier League and other clubs across the football pyramid.

Software Engineer

NHS England - December 2024 to February 2025. Contract outside IR35.
1st version. Python healthcare management application.

- Delivered a 1st version for desktop application driven by AI in Python and Selenium to automate features in a 3rd Party healthcare application used nationwide by GPs.
- Rebuilt a 2nd version also driven by AI built in Typescript, React, Tailwind and Playwright for automation, Electron wrapped desktop application.
- Purpose of the product was to automate a bulk creation and deletion of templates which removes a time & labor inefficiency in using 3rd Party software.

Algorithm Tutor

Titanium Tutors - November 2024 to April 2025. Self-employed.

- Tutored university undergraduate student. Coding in Python, I taught algorithm theorems, data structures and strategies too.
- Curated lessons to build self confidence in finding correct implementation for algorithms.
- Goal was to pass technical tests for internships.

Senior Software Engineer

Fvtvre - April 2024 to July 2024. Equity-based ownership model.
.NET 8 microservice platform, B2B property management product.

- Developed a .NET 8 microservice API and Vue.js frontend for property management.
- KSA based startup, we build a property management product and rolled it out to EJAR, the Saudi department of rent. The goal was to enhance their laborious inventory assessment of properties.

Senior Software Engineer

SalaryFinance - August 2021 to April 2024. Permanent role. Volunteered for redundancy as I wanted a new challenge.
.NET 6 microservices platform. B2B to B2C loan products and salary advancement.

- Technical lead on critical project, Tahiti, a consumer duty project instructed by the FCA, I helped save the company millions in fines. 70/80 hours p/w for in October 2023. 50/70 hours for 3 months between September to December 2023. Meetings with the leadership team discussing implementation, outcomes and future deliverables.
- New feature development was blocked, a company OKR focus was to clear prod issues. I resolved 500+ prod issues in 6 months, some tickets were as old as Sept 2021, finding root cause fixed. I solved issues in 80% less time than other engineer, met OLAs completion times and unblocked new feature development.
- Front-end features built Vue.js and TypeScript and back-end features in C# on main revenue product loans, customer ops applications and lowest level financial accountancy model service which both revenue products, loans and salary advancements were dependent on.
- Proactively applying root cause fixes to recurring issues in key microservices.
- Created and updated processes and playbooks to aid knowledge sharing.
- Mentored Junior Engineers and took on Lead Developer duties in the Lead's absence.
- Involved in debt sale implementation, writing out documentations, and presenting application to external client.

Senior Software Engineer

Optal - May 2018 to April 2021. Permanent role. Sold to **Wex** in April 2021 and made redundant.
Monolith platform. B2B e-card payments for travel websites.

- Developed desktop applications for an accounts management system which reconciled millions of daily card transactions derived from travel websites Expedia.com and Booking.com, this was reconciled against Ixaris and MasterCard data. Then settled across 50+ bank accounts and across 10 international entities.
- High-throughput design, root-cause production engineering, and money-movement reconciliation, plus the accountant-facing UI for handling payments and escrow flows between accounts.

Abel Ghebrezadik

IT Consultant (Junior Software Engineer)

FDM Group - May 2016 to May 2018. Graduate scheme. Contracted to London Metal Exchange

- Built new functionality for existing internal trading and reporting applications in C++, Java and C#.
- Created a SOAP API application for internal staff to retrieve relevant company data for reporting purposes, developer reports using Power BI and SSRS, developed ETL from MSSQL Warehouse using SSIS to populate data which was exposed by the application.
- Scripted in variety of languages from Perl, PowerShell, Batch in archaic systems in order to expedite operations for different internal teams.

Education

University of Southampton

BSc Mathematics (2:1) - October 2009 to June 2013

Woodhouse College

A-Levels: Mathematics (A), Economics (A), Sociology (B) - August 2007 to June 2009

Interests

I enjoy building websites and apps for external ventures. I am also a fan of physical endurance challenges, having completed the Hackney Half Marathon, London Olympic Triathlon, and Tough Mudder.

An example of my AI driven ventures also listed on website, wedding platform I built <https://www.whenwillyoumarry.com/>, example of a live website on the platform <https://milkandkifle.com/>. Additionally, <http://www.cabeazy.com/> an office ride-hailing platform/auto dispatch platform.

Whenwillyoumarry.com created in React.js, Next.js, TypeScript and Node. Cabeazy.com written using React Native, React.js, Next.js, TypeScript and Go. I host my applications in Railway.com for the mean time whilst things are in beta. I built out automated mobile builds for mobile apps using a Hetzner AX41 server.

I built out every money-moving event via Stripe, from driver/customer onboarding through to payout. I built a refund pipeline that auto-resolves clear-cut cases (driver cancelled, abandoned hold, duplicate charge) and routes ambiguous ones through a refund requests table to a role-based admin dashboard with full or partial approval. Plus daily payout jobs, stale-hold cleanup, and a passenger-side Stripe Payment Sheet with Setup Intent and Apple/Google Pay. WWYM runs on similar Stripe foundations.

Beyond the technical fit, running two products solo has forced me into the choosing the correct product providers to lower costs fir startups like hosting, email domain management, email/SMS broadcaster, payment providers, billing provider, reporting providers, observability tools, alerting, analytics.
